NFTS HOST BASED USB Device Forensic Analysis Report

Analyst: Julian Derry
Date: July 2026

Table of Contents

Executive Summary

This report documents a digital forensic examination of a Windows 11 virtual machine (win_11_vm) to identify and analyze USB device activity on the system. The examination focused on confirming the identity of a connected USB device, determining the assigned drive letter, identifying the Windows user who interacted with the device, identifying files accessed from the device, and determining whether files were copied between the USB device and the host computer. Registry artifacts, file system artifacts, and application artifacts were correlated to build a timeline of USB activity.

Scope and Objectives

The examination sought to answer the following questions:

- What is the identity of the USB device connected to the system, including manufacturer, model, and serial number?
- What drive letter was assigned to the USB device?
- Which files were opened from the USB device?
- Which Windows user profile interacted with the USB device?
- Which applications opened files from the USB device?
- Were any files copied between the USB device and the computer?

Host Details

Attribute	**Value**
Device name	win_11_vm
Processor	13th Gen Intel(R) Core(TM) i5 13420H (2.61 GHz) (2 processors)
Installed RAM	8.00 GB
Graphics card	VMware SVGA 3D (4 MB)
Storage	37 GB of 64 GB used
System type	64 bit operating system, x64 based processor
Pen and touch	Touch support with 8 touch points
Edition	Windows 11 Pro
Version	25H2
Installed on	6/25/2026
System Timezone	GMT
OS build	26200.8875
Experience	Windows Feature Experience Pack 1000.26100.334.0

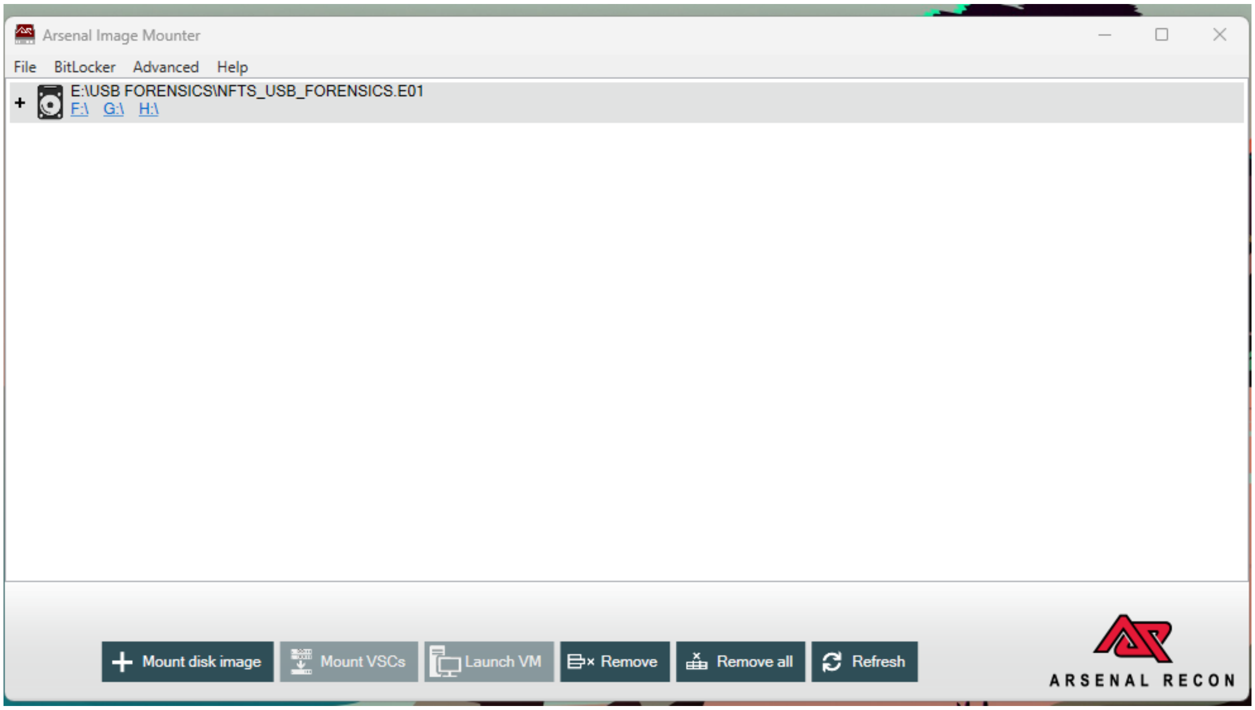
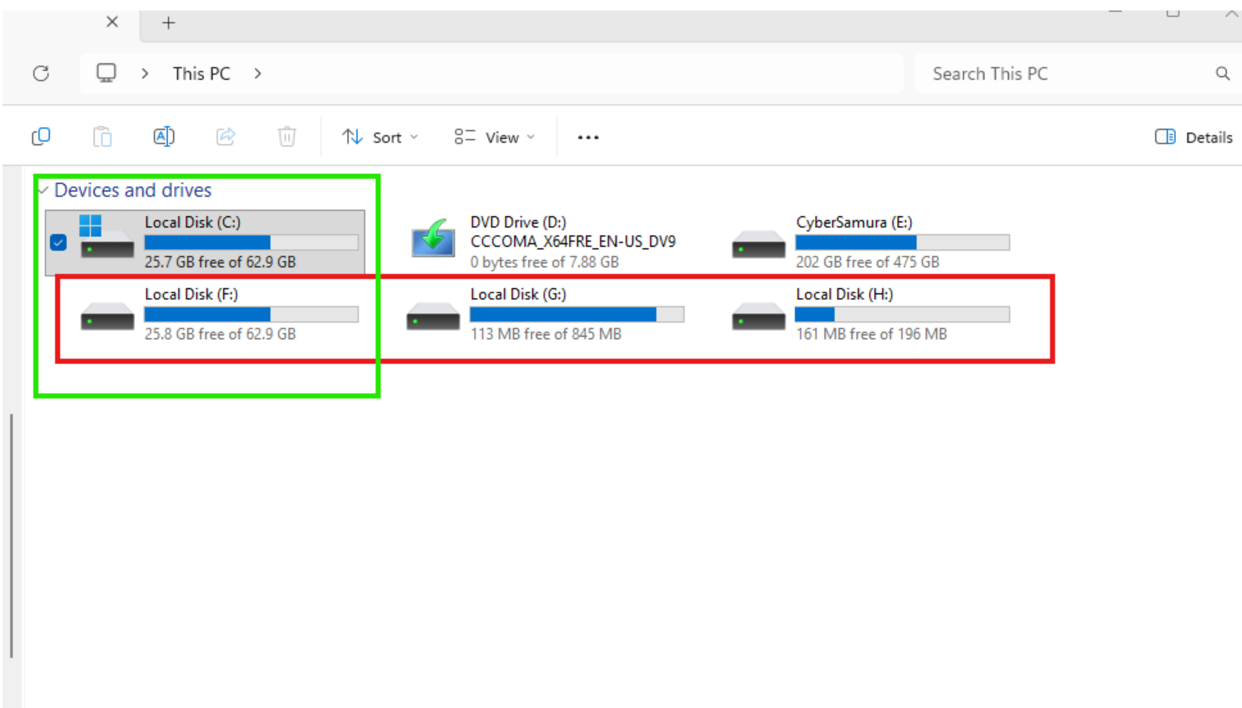
The image was mounted using Arsenal Image Mounter v3.12.331. This approach was taken because mounting the image as a physical disk, rather than only a logical volume, allowed other tools used in this examination, including KAPE, Eric Zimmerman's tools, and virtual machine software, to interact with it as actual storage. The image was mounted as a Disk device with write temporary changes stored in an alternate differencing file location, so as not to modify or alter the original image file. The mounted image was assigned drive letter F.





Tools and Methodology

The following tools were used during this examination:

- FTK Imager v8.2.0.33 SP1, for acquisition
- Arsenal Image Mounter v3.12.331, for mounting the E01 image

- KAPE (gkape v1.3.0.2), for targeted collection and processing
- EZParser module, run within KAPE
- MFTECmd, RECmd, and EvtxECmd, run as KAPE modules for timeline creation
- Registry Explorer, for registry hive analysis
- USB Detective, for USB artifact verification
- Timeline Explorer, for reviewing KAPE module output CSV files

KAPE was run to collect Registry targets, specifically NTUSER.DAT, SYSTEM, SOFTWARE, SAM, SECURITY, and USRCLASS.DAT, along with the USBDetective target and supporting artifacts including $J, $LOGFILE, and $MFT. The USBDetective Windows application was also used separately for redundancy, along with USBDeviceLogs, to provide redundancy for USB artifacts and logs.

For timeline creation, the following KAPE modules were run: EZParser, MFTECmd, RECmd, and EvtxECmd. The module output folder contained several folders of categorized CSV files, which were reviewed using Timeline Explorer.

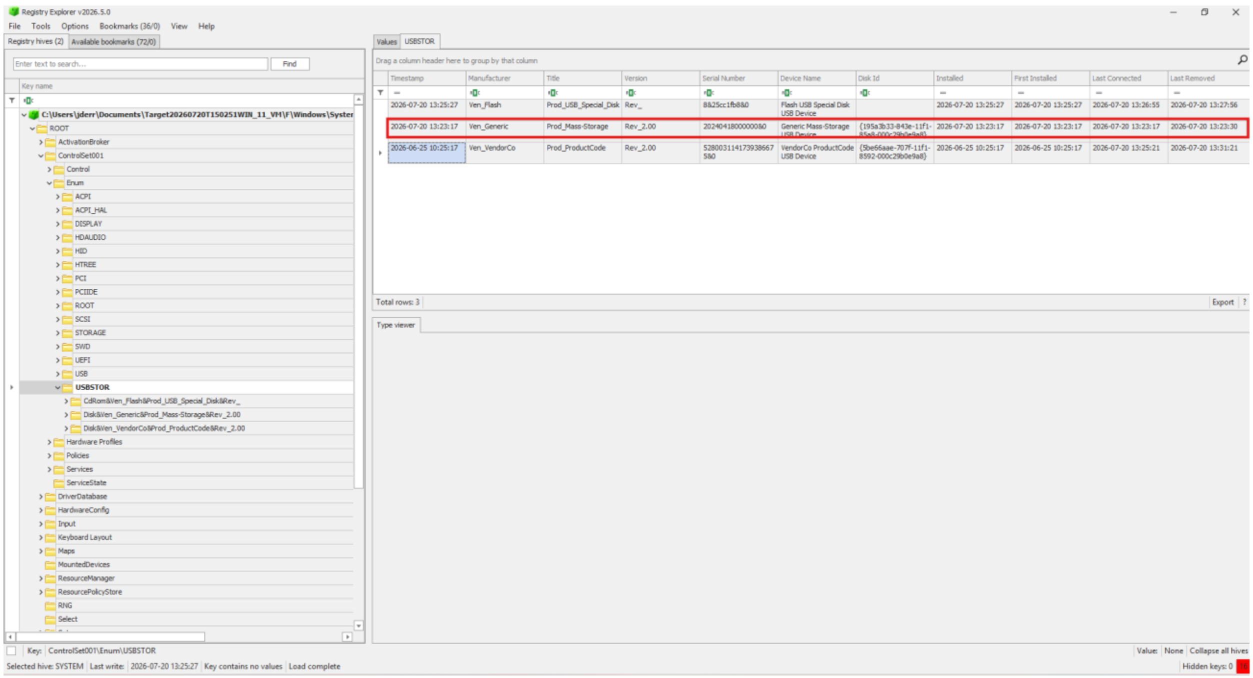
Findings

USB Device Identity

Registry Explorer was used to load the SYSTEM hive and examine SYSTEM\CurrentControlSet\Enum\USBSTOR. Three USB devices were present under this key. The examination focused on the most recently inserted device, connected on 2026 07 20 at 13:23:17. Manufacturer, version, serial number, device name, installed, first installed, last connected, and last removed data were available under this key.

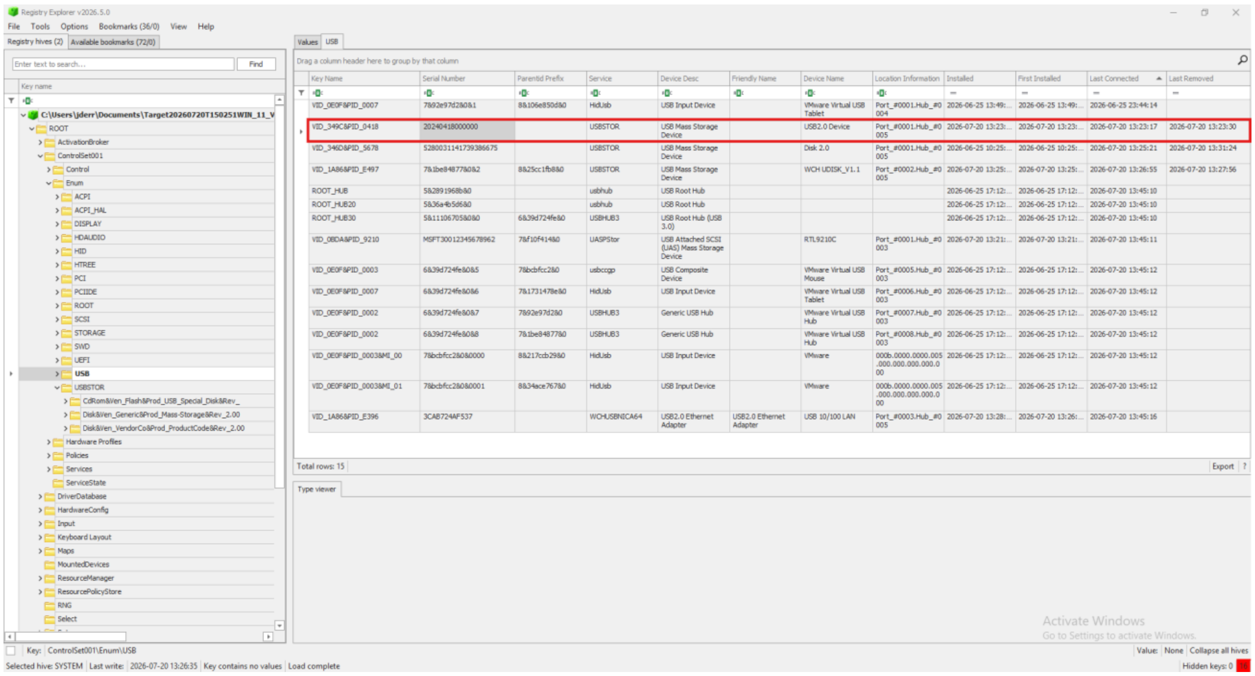


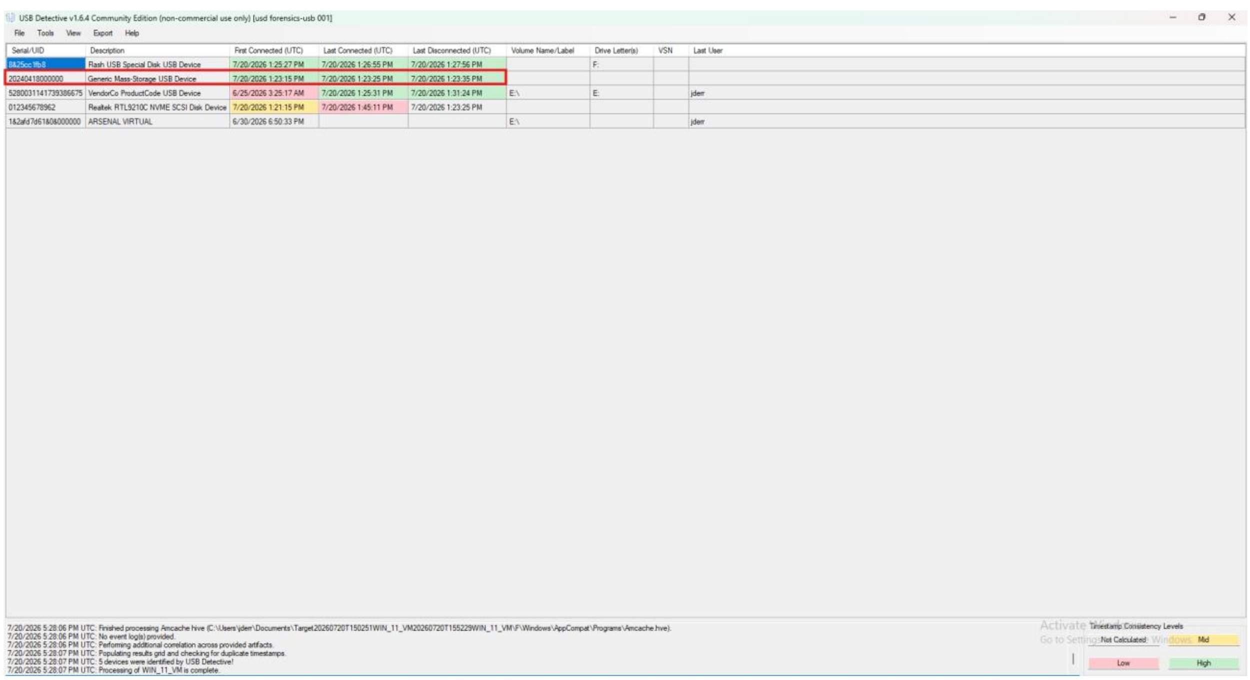
The value 8&25cc1fb8&0 seen under USBSTOR is a Windows generated ParentIdPrefix, created when a USB device does not report a unique serial number to the operating system. This can be identified by the presence of ampersands in the value.

To verify the actual device serial number, the following locations were checked:

- SYSTEM\CurrentControlSet\Enum\USB
- MountedDevices
- SetupAPI.dev.log

SetupAPI.dev.log may explicitly indicate that a device has no serial number, or may show how Windows enumerated the device. In this case, SYSTEM\CurrentControlSet\Enum\USB showed the same date and time as USBSTOR, but with a serial number of 20240418000000, without the ampersands present in the USBSTOR entry. USB Detective was also used for verification and returned a device with the same serial number, 20240418000000, and a similar timeline.

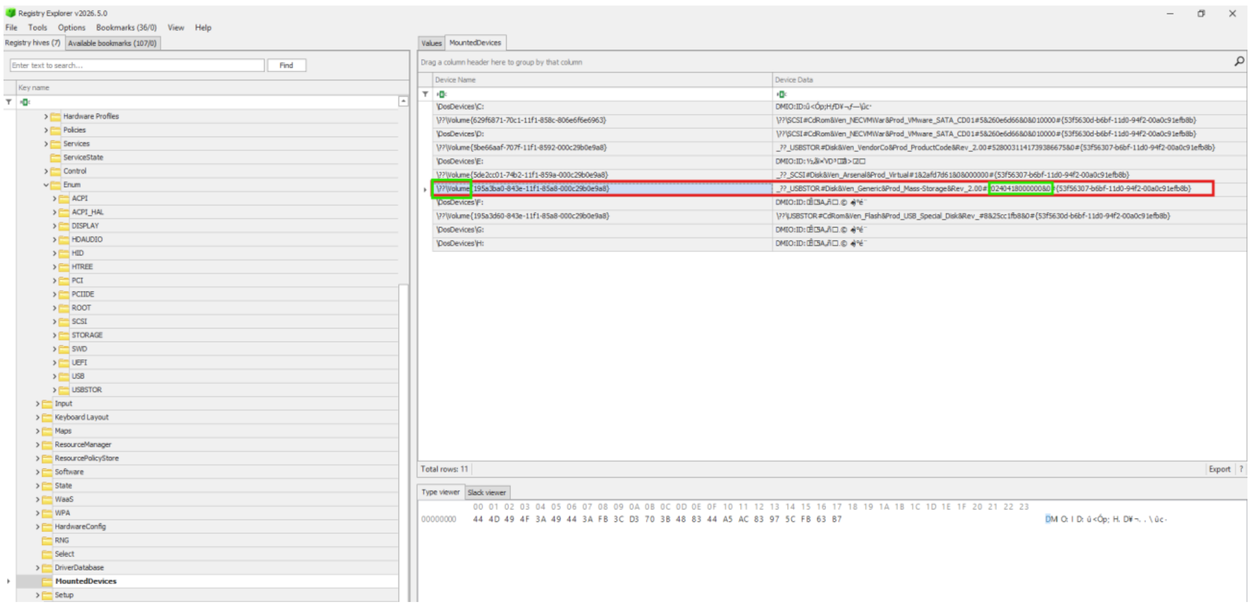




It was noted during this examination that the serial number can also be identified from the numbers assigned to the drive in the folder name listed under USBSTOR, which may be either globally or system unique, and that the last write time can be identified in the last write time field associated with the serial number in that folder name.

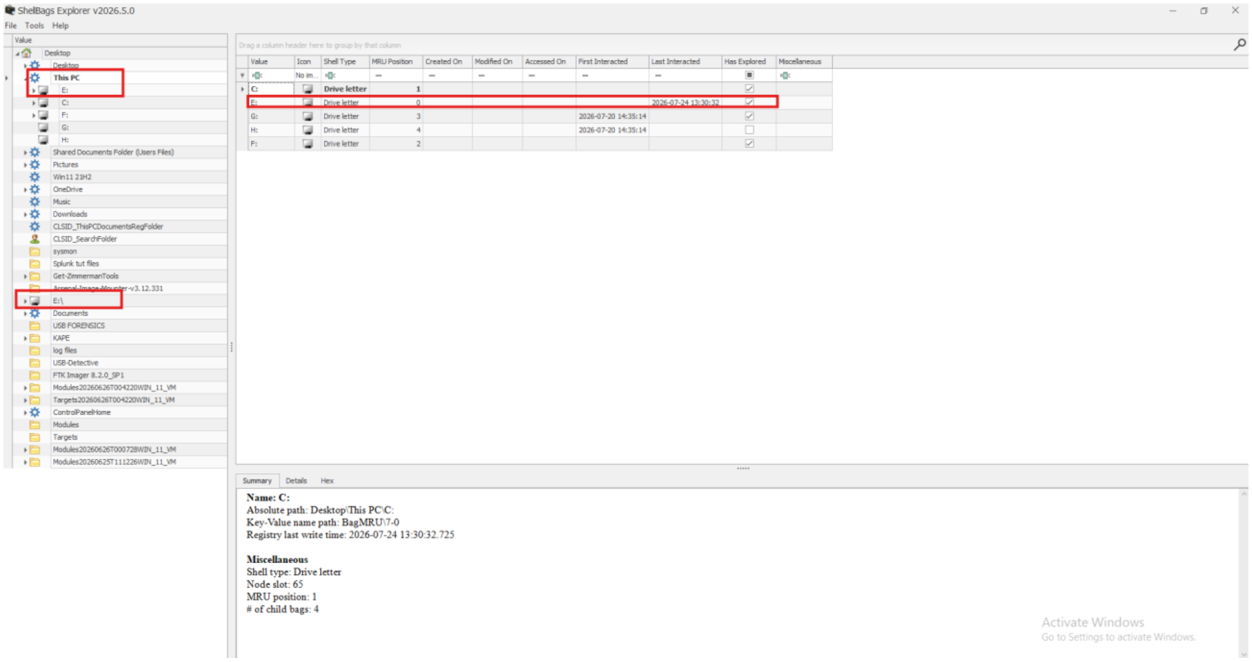
Assigned Drive Letter

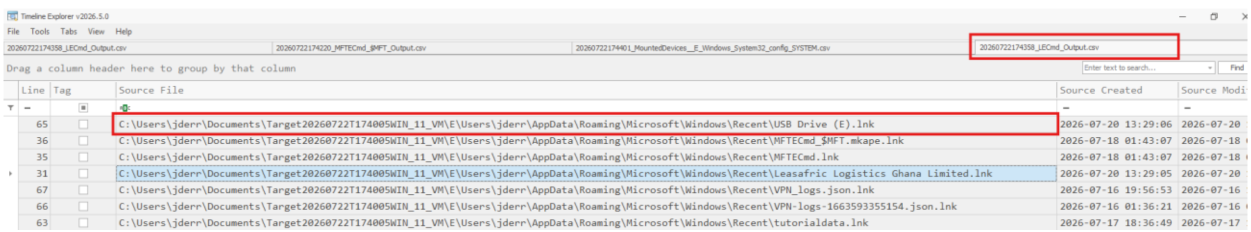
MountedDevices was checked to determine whether the drive had mounted properly, since a drive letter could not initially be identified elsewhere. The serial number was present, confirming this was the drive under examination, however no drive letter was assigned to it, only a \??\Volume reference.



Possible reasons for this include the use of a low-quality flash controller in the device, which can cause a disconnect during initialization and interrupt Windows partway through mounting, corrupted partition tables, or automount being disabled. Given that other drives on the system had letters successfully assigned, the low-quality flash controller explanation was assessed as the most likely cause.

The drive was later confirmed to have been assigned drive letter E, through LNK file and ShellBags artifacts. The date and time recorded in ShellBags aligned with when the USB device was first installed, and the Has Explored box was checked for this entry.





USB Device Registry Artifacts

Attribute	Value
USB Device Name	Generic Mass Storage USB Device
Manufacturer	MASS STORAGE USB DEVICE / Ven Generic
Model	VID_349C&PID_0418
Serial Number	20240418000000
Installed	2026 07 20 13:23:17.4716162
First Installed	2026 07 20 13:23:17.4716162

Last Connected	2026 07 20 13:23:17.4639635
Last Removed	2026 07 20 13:23:30.1536493
Port Number	Port_#0001.Hub_#0005
User Profile	Jderr
Timezone	UTC
Assigned Letter	E (confirmed via LNK file and shellbags)

The manufacturer field appears as Generic MASS STORAGE USB DEVICE and Ven Generic because the device is unbranded.

Files Opened from the USB Device

The LECmd.csv output was reviewed, filtered by Drive Type to Removable storage media (Floppy, USB). The local path and working directory values both began with E:\. A file named Leasafric Logistics Ghana Limited.pdf, opened from the USB device, was identified in this output. The source created and accessed timestamps for this file matched the timeline of when the USB device was inserted into the system. This file was also visible under the Target Name field in NTUSER.DAT.csv, along with an entry for USB DRIVE (E:), with ascending MRU positions and corresponding timestamps.

User Who Interacted with the USB Device

The Jderr user profile interacted with the USB device. This was the only user profile present across the reviewed CSV files, including FileFolderAccess, Jump Lists, AutomaticDestinations, and LECmd.csv.

Application That Opened Files from the USB Device

Microsoft Edge (Chromium) was the application that opened the file Leasafric Logistics Ghana Limited.pdf. This was identified in AutomaticDestinations.csv, where the Path column contained the USB drive letter and file, E:\Leasafric Logistics Ghana Limited.pdf, corresponding to a Microsoft Edge (Chromium) entry. The Target Accessed and Last Modified timestamps for this entry were correlated and found to align.

File Copying Between USB and Computer

No evidence was found of files being copied between the USB device and the computer. Both the local path and the TargetID Absolute Path fields reviewed show only the E:\ path.

Registry Hive State

Registry Explorer reported that the SYSTEM hive was in a dirty state, with associated transaction logs (.LOG1 and .LOG2) present and requiring replay. This indicates the hive did not necessarily represent the most recently committed state at the time of acquisition.

This condition was anticipated, since the evidence was acquired from a live Windows system, and registry hives on live systems are commonly left in a dirty state because pending transactions have not yet been committed to the hive files. The presence of transaction logs is therefore considered an expected characteristic of live acquisitions rather than an indication of evidence corruption.

As a result, USB related artifacts, including connection history, registry key LastWrite timestamps, and derived timestamps such as Installed, First Installed, Last Connected, and Removed, may be incomplete, outdated, or may reflect only the last committed transaction. These artifacts were interpreted with appropriate caution during this examination.

A separate technical guide was previously produced documenting the causes of dirty registry hives, their impact on forensic analysis, and the process of replaying registry transaction logs to recover the most current registry state. That methodology applies directly to this case and provides additional context for interpreting the registry evidence.

Reference: Registry Transaction Log Replay (Dirty Hive Recovery), insert link to documentation.

Additionally, the SYSTEM hive contained the registry value NtfsDisableLastAccessUpdate, with a value of 2147483650 (0x80000002). This indicates that NTFS last access timestamp updates were disabled under a system managed configuration. As a result, NTFS Last Access timestamps may not reliably reflect file access activity on this system.

6/25/2026	Windows 11 Pro installed on host system
2026 07 20, 13:23:17.4639635	USB device (Generic Mass Storage USB Device, Serial Number 20240418000000) last connected
2026 07 20, 13:23:17.4716162	USB device installed and first installed
2026 07 20, 13:23:30.1536493	USB device removed
7/20/2026	File Leasafric Logistics Ghana Limited.pdf opened from USB device (E:) using Microsoft Edge (Chromium), under user profile Jderr
7/20/2026	E01 image (NFTS_USB_FORENSICS.E01) acquired using FTK Imager v8.2.0.33 SP1

Conclusion

The examination identified a Generic Mass Storage USB Device, Serial Number 20240418000000, connected to the win_11_vm system on 2026 07 20 at 13:23:17 and removed at 13:23:30. The device was assigned drive letter E, confirmed through LNK file and ShellBags artifacts, although this letter was not visible in MountedDevices due to no letter being assigned there. The user profile Jderr interacted with the device, and Microsoft Edge (Chromium) was used to open the file Leasafric Logistics Ghana Limited.pdf from the device. No evidence was found that files were copied between the USB device and the host computer. Registry hive dirty state and the disabling of NTFS last access timestamp updates were both noted as factors affecting the reliability and completeness of certain timestamp-based artifacts, and findings were interpreted accordingly.

Exhibits and Appendices

- Host system details (see Host Details table above)
- E01 image hash values, MD5 and SHA1 (see Evidence and Chain of Custody table above)
- SYSTEM\CurrentControlSet\Enum\USBSTOR registry key
- SYSTEM\CurrentControlSet\Enum\USB registry key
- MountedDevices registry key
- SetupAPI.dev.log
- LECmd.csv
- NTUSER.DAT.csv
- AutomaticDestinations.csv
- FileFolderAccess, Jump Lists CSV output
- Registry Transaction Log Replay (Dirty Hive Recovery) technical guide, insert link to documentation
