

Case **HIVE-2026-BF-0117**

Browser Forensics Training Case (Autopsy E01 edition)

Evidence: **HIVE-2026-BF-0117-USB.E01**

All times UTC · Property of HIVE CONSULT | Developed by Nana Sei Anyemedu

SCENARIO

Adinkra Microfinance Ltd (Accra) suspects that a member of its finance team, who works on workstation FIN-WS-07, has been job-hunting on company time and has moved a confidential client list out of the organisation ahead of resigning to start a competing practice. During the review, a USB flash drive linked to the subject was seized and imaged. HIVE CONSULT has been engaged to examine the image, reconstruct the subject's web activity, and determine whether the browsing history is corroborated by documents and receipts held on the drive.

The drive holds a preserved copy of the subject's Google Chrome profile (collected with its original AppData path intact) together with personal documents, receipts and images. Work the case in Autopsy and answer the questions below, supporting every finding with a timestamp and the artifact it came from.

Subject: Kwabena Asare, Staff Accountant, Adinkra Microfinance Ltd, Accra.

PART A — BROWSER HISTORY

Question 1 (Beginner): Last known activity What was the title and full URL of the very last web page the subject visited, and the exact date/time (UTC)?

Question 2 (Beginner): Signs of an exit plan From the recorded search terms, list the searches that indicate the subject was seeking new employment or planning to start their own practice. Ignore leisure searches.

Question 3 (Intermediate): Personal cloud storage & possible exfiltration (a) Name the cloud service the subject used. (b) Give the date/time it was FIRST accessed. (c) How many times was it visited in total? (d) Identify the specific page indicating files were moved INTO the service.

Question 4 (Intermediate): Intent versus accident Two job-search sites appear in the history. One was reached by the subject typing the address directly (prior intent); the other only via a search-result link. Name the directly-typed site with its date/time, and explain why a 'Typed' visit carries more evidential weight than a 'Link' visit.

Question 5 (Intermediate) : Reconstructing the 19 September session On 19 September 2023 the subject ran a marketplace search for second-hand hardware. Using the referrer/visit relationship, identify the exact item (make and model) viewed, its listed price, and the time of the visit.

PART B — CORRELATING THE BROWSER WITH THE DRIVE

Question 6 (Intermediate): The exfiltrated data The drive contains a spreadsheet of customer data. Name the file and its folder, and explain how it corroborates BOTH the QuickBooks-export search and the Dropbox upload page from Part A.

Question 7 (Intermediate): Following the money A receipt confirms the laptop the subject viewed on eBay was actually purchased. Which exhibit is it, what was the item total, and does the item match the listing from Question 5?

Question 8 (Beginner): Documented intent to leave Name at least two documents on the drive that show the subject intended to resign and set up a competing accountancy practice.

Question 9 (Intermediate): The exfiltration channel An email exhibit shows how the data left the organisation. Who was it addressed to, and what did it share? How does this line up with the Dropbox activity in the browser history?

Question 10 (Intermediate): Build the timeline Produce a short timeline (15–20 September 2023) that interleaves the key browser events with the on-disk artifacts (registration, uploads, purchase, resignation draft) to tell the story of the subject's actions. *Where to look: combine Web History timestamps with document/receipt dates.*
